

**Amendments to the Abstract**

Please amend the abstract so that it reads as follows:

---

Provided is a photosensitive body and an image forming device using the same. The image forming device is small, high speed and capable of color output, even when tension and compression forces are repeatedly applied to the belt-type photosensitive body. The photosensitive body includes a photosensitive layer, an electron transport agent, and a resin binder. The charge generating agent contains titanyl phthalocyanine; and the resin binder contains polycarbonate resin.
